Program: BS Computer Science	Professor: Sir Andrew Ramos

Final Project

What Does the Knowledge Base Search Use to Rank Notes

Answer

The Knowledge Base holds notes the user uploads, pastes or copies from Notion [1]. Search is local keyword ranking with BM25, using k1 = 1.4 and b = 0.75 [1]. Questions go to the Knowledge Base, where the top passages are retrieved and the answer cites them as numbered sources [1].

Supporting facts

- Notes Scout (best tier) finds deadlines in notes that never made it into Reminders [2].
- Notes are split on blank lines and headings, then packed into chunks of about 900 characters [1].
- Reader (code tier) reads the Tasks page, Reminders, Notes and the Stocks sheet [2].
- Each note is stored as a JSON file [1].

Risks and limitations

- Morning brief covers what matters today, what is due within three days, and anything in the Worries note [3].
- If the crew is already busy, the chat says so instead of starting a second run [1].
- Writer (code tier) is the only agent allowed to change Notion or Sheets [2].
- Briefer (smart tier) writes the morning brief [2].

[2] architecture.md

[3] routines.md

Review

- Reader opened 3 documents through the MCP server (architecture.md, model-router.md, knowledge-base.md).

- Notes Scout checked the Reader's 12 notes against the retrieved passages: 9 supported, 3 dropped.
- Checker, round 1: sent the draft back to the Writer (over the word limit).
- Checker, round 2: approved, 9/9 statements supported by the sources; still open: over the word limit.
- Writer revised the draft once to address the Checker's notes.
- Publisher combined the approved draft with 3 source documents and shortened it to the word limit.
